Installation of the Weblinks Browser Plugin (for Google Chrome)
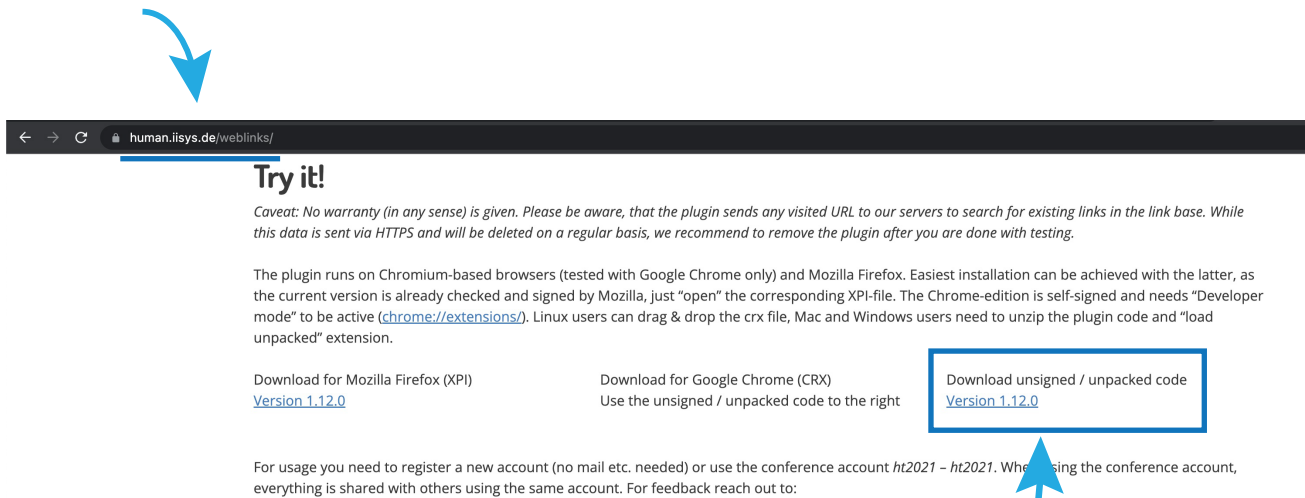

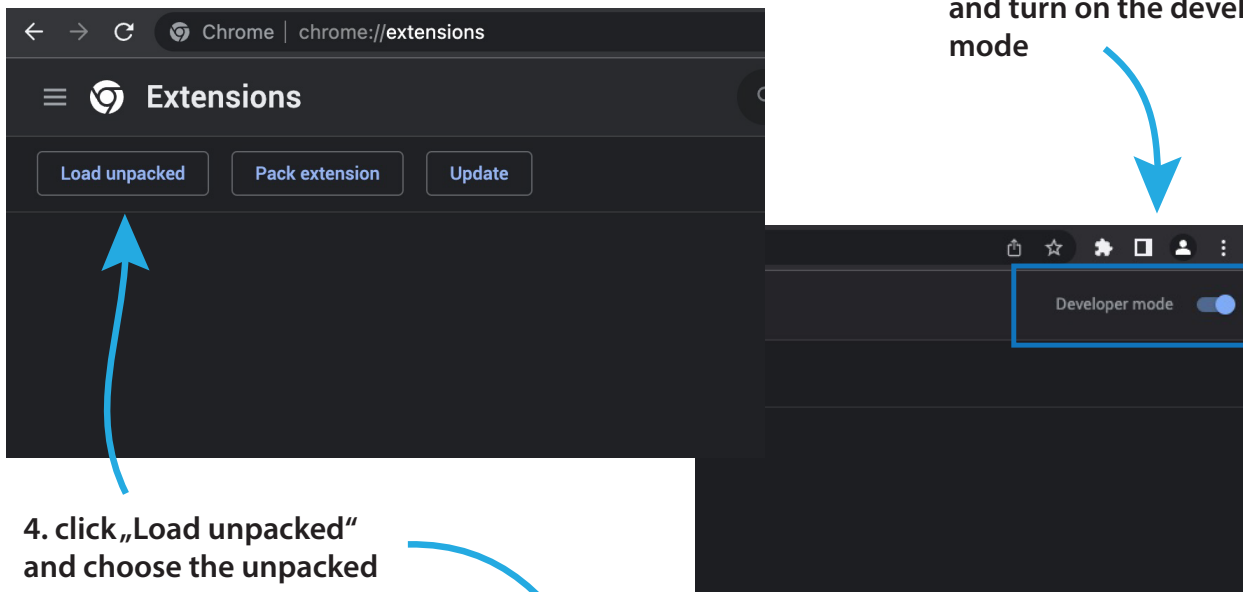

1. Go to the website www.human.iisys.de/weblinks

human.iisys.de/weblinks/

Try it!

Caveat: No warranty (in any sense) is given. Please be aware, that the plugin sends any visited URL to our servers to search for existing links in the link base. While this data is sent via HTTPS and will be deleted on a regular basis, we recommend to remove the plugin after you are done with testing.

The plugin runs on Chromium-based browsers (tested with Google Chrome only) and Mozilla Firefox. Easiest installation can be achieved with the latter, as the current version is already checked and signed by Mozilla, just "open" the corresponding XPI-file. The Chrome-edition is self-signed and needs "Developer mode" to be active (chrome://extensions/). Linux users can drag & drop the crx file, Mac and Windows users need to unzip the plugin code and "load unpacked" extension.

Download for Mozilla Firefox (XPI)　　　Download for Google Chrome (CRX)　　　Download unsigned / unpacked code
Version 1.12.0　　　　　　　　　　　　　Use the unsigned / unpacked code to the right　　Version 1.12.0

For usage you need to register a new account (no mail etc. needed) or use the conference account *ht2021 – ht2021*. When using the conference account, everything is shared with others using the same account. For feedback reach out to:

2. download the „unsigned/unpacked code" version and unzip the folder

3. open Chrome and go to chrome://extensions and turn on the developer mode

Chrome | chrome://extensions

Extensions

Load unpacked　　Pack extension　　Update

Developer mode

4. click „Load unpacked" and choose the unpacked Weblinks folder

5. confirm your selection and you're good to go!
